No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                     May 12, 2003, 15:31:22; Search time 71.5 Seconds (without alignments) 46.591 Million cell updates/sec

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to a new nerve regenerative material which contains a peptide immobilised to a base which consists of a polysaccharide gel such as alginic acid. Sequences AAB12886-B12899 represent examples of the peptides used in the nerve regeneration material. The peptide containing material causes nerve cell prolliferation and also causes axonal extension. The material can be used for the treatment of central or peripheral nervous system disorders,
The present invention describes a material for medical treatment which comprises one or more peptides of the formula XADEGJIMProQY, or their salts, immobilised on a substrate: where X = H, CH3CO or CH3COLys;
A = Ser or Thr: D = ILe, Val or Leu; E = Lys or Arg; G = ILe, Val or Leu; J = Gly or Ala; L = ILe, Val or Leu; M = Gly or Ala; Q = Gly, Ala or Gly-Lys-Lys-Gly; Y = OH or NH2. Also described is an agent for cell growth promotion and/or cell adhesion promotion containing the above peptide or its salt as the active component. The peptide and its salt can be used for covering injuries, promoting adhesion of blotissues, bone reinforcing and nerve regeneration. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nerve regeneration; nerve cell proliferation; axon extension; treatment;
                                                                                                                                                                                                                                                                                                                                                                        Gaps

neutrophil cell chemotactic agent. (1) has vulnerary and antiinflammatory activities. (1) is useful as a potent neutrophil cell chemotactic agent and for generating antibodies against the peptides, which are useful for modulating neutrophil recruitment to a wound site for enhancing or inhibiting inflammation and early effects of wound healing. Neutrophil response to (1) is specific, since monocytes and fibroblasts do not show any expression of the receptor to which (1) binds. The present sequence represents a human thrombin receptor binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            domain peptide which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New synthetic neutrophil cell chemotactic peptides, useful for generating antibodies for modulating neutrophil chemotaxis in immune response and wound healing -
                                                                                                                                                                                                                                                                                                                                            Neutrophil cell chemotactic; wound healing; inflammation; vulnerary;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; proteolytically activated receptor for thrombin; neutrophil;

Stimulating growth and repair of cartilage, useful for treating e.g. arthritis, by local administration of an agonist of non-proteolytically activated thrombin receptor
                                                                                                                                                                                                                                                                The invention relates to a method of stimulating growth and repair of cartilage. The method involves administering to the site, an agonist of non-proteclytically activated thrombin receptor (NPAR). The method is used in human or veterinary medicine for the treatment of arthritic
                                                                                                                                                                                                                                                                                                                                             joints and damage/loss of cartilage caused by traumatic injury. Also chouforcytes may be cultured in presence of NPAR agonist to provide cells for implantation at sites requiring growth/repair of cartilage. The present sequence is human thrombin peptide derivative which serves
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Thrombin; revascularisation; vascular occlusion; tissue repair; vulnerary; vasotropic; cardiant; anglogenesis; restenosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Thrombin-derived peptide used to promote cardiac tissue repair

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to novel synthetic peptides and antibodies which are potent chemotactic agents for neutrophils. The peptides of the invention minic the activity and role of the cleavage fragment of the proteolytically activated receptor for thrombin (PART). They are useful for generating or modulating neutrophil cell chemotactic migration or are useful for modulating neutrophil recultment to a wound site for an antibody. In particular, the peptides of the invention enhancing or inhibiting inflammation and early effects in wound healing. They are also useful for modulated neutrophil chemotaxis in immune response. The present sequence is high affinity receptor binding domain of human thrombin. This peptide is used in the exemplification of the invention.

cleavage of prothrombin (PTh) to thrombin (Th) by prothrombinase (I), at a site remote from the catalytic site of (I) comprises: (a) preparing a solution containing 0.05-20 mu M substrate (S), that includes a protease cleavage site and exosite-binding determinant; 0.05-200 nm factor vs; 30-500 micro M phospholipids (PL); test inhibitor (A) in buffer of pH 7-9, containing 1-10 nm calcium ions but no calcium-chelating agent; (b) initiating catalytic cleavage of (S) by adding an aliquot of factor Xa (to final concentration 0.05-200 nm) so that there is an excess of va over Xa, forming a S/(I) complex; (c) withdrawing aliquots of the The present peptide comprises a thrombin-derived peptide, TP508, that includes a thrombin receptor binding domain sequence (see also AAM50856) and a serine esterase conserved sequence (see also eardiectissue repetide is used in a claimed method for promoting cardiac tissue repair. It is administered during or following cardiac surgery by injection into cardiac tissue, and may be formulated as a sustained release formulation. The thrombin derivative peptide is also used in claimed methods of stimulating revascularisation, stimulating vascular endothelial cell An exosite assay has been developed for inhibition of the catalytic Exosite assay for agents that inhibit catalytic cleavage of prothrombin - at sites away from the active site of prothrombinase, also new inhibitors, potentially useful as anticoagulants proliferation, inhibiting vascular occlusion, and inhibiting restenosis following balloon angloplasty, in which case it may be coated onto the catheter. reaction mixture, quenching them; and (d) assaying for concentration of Th. Alternatively, in the initial solution S is replaced by the same concentration of Xa (less than the amount of Va), and reaction is started by adding S. Also described in the present invention are inhibitors (A') had having 1650 less than 1 mu M identified by this assay. (A') are potentially useful as a new class of anticoagulants for treatment of cardiovascular disease, stroke and haematological disorders. The method substrate specificity in catalytic formation of Th. The present sequence represents human zeta 2 prethrombin 2. Prothrombin mutants having one or more changes in amino acid sequence compared with the natural protein and having 0-10% (preferably 0-0.25% of the activity of the natural protein are claimed, provided that the changes in amino acid sequence do not affect the capacity of the mutants to bind to specific ligands and receptors. The mutants have greatly reduced clotting activity and are useful as antagonists of thrombin inhibitors such as hirudin, heparin and anti-thrombin III. The mutations may also result in changes to the in vivo half-life Gaps Prothrombin; mutant; mutein; platelet aggregation; blood clotting; coagulation; reduce; decrease; hirudin; heparin; anti-thrombin III; antagonist; D99N. /note= "Wild-type Asp residue has been replaced Prothrombin mutants with reduced clotting activity - useful as antagonists of thrombin inhibitors or for anticoagulant therapy ö Length 116; Indels Schlokat 85.8%; Score 121; DB 20; illarity 100.0%; Pred. The mutant thrombin is produced in recombinant cell culture or by in vitro methods, and is used to treat thrombotic conditions, particularly during cardiac bypass surgery and in cases of septic shock.

Protein

```
The mutant thrombin sequence, generated by oligonucleotide-directed mutagenesis, has at least 80% homology with thrombin, and is capable of protein-c activation without significant fibrinogen clotting activity, and vice versa (specifically, it has a ratio of protein-C activity to fibrinogen clotting activity of less than 0.5 or greater than 2 compared to thrombin). The mutant thrombin is produced in recombinant cell culture or by in vitro methods, and is used to treat thrombotic conditions, particularly during cardiac bypass surgery and in cases of septic shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          rnrombin derivs with segregated pro- and anticoagulant activities
useful for treating thrombotic disorders but also diagnosis,
treatment of tumours, etc.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The mutant thrombin sequence, generated by oligonucleotide-directed mutagenesis, has at least 80% homology with thrombin, and is capable of protein-C activation without significant fibrinogen clotting activity, and vice versa (specifically, it has a ratio of protein-C activity to fibrinogen clotting activity of less than 0.5 or greater than 2 compared to thrombin). The mutant thrombin is produced in recombinant cell culture or by in vitro methods, and is used to treat thrombotic conditions, particularly during cardiac bypass surgery and in cases of septic shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Thrombin derivs with segregated pro- and anticoagulant activities useful for treating thrombotic disorders but also diagnosis, treatment of tumours, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

Protein

```
The mutant thrombin sequence, generated by oligonucleotide-directed mutagenesis, has at least 80% homology with thrombin, and is capable of protein-C activation without significant fibrinogen clotting activity, and vice versa (specifically, it has a ratio of protein-C activity to fibrinogen clotting activity of less than 0.5 or greater than 2 compared to thrombin). The mutant thrombin is produced in recombinant cell culture or by in vitro methods, and is used to treat thrombotic conditions, particularly during cardiac bypass surgery and in cases of septic shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The mutant thrombin sequence, generated by oligonucleotide-directed mutagenesis, has at least 80% homology with thrombin, and is capable of protein-C activation without significant fibrinogen clotting activity, and vice versa (specifically, it has a ratio of protein-C activity to fibrinogen clotting activity of less than 0.5 or greater than 2 compared to thrombin). The mutant thrombin is produced in recombinant cell culture or by in vitro methods, and is used to treat thrombotic conditions, particularly during cardiac bypass surgery and in cases of septic shock.
                                                                                                                                                                                                                                                                                                                                                                                                     Thrombin derivs with segregated pro- and anticoagulant activities useful for treating thrombotic disorders but also diagnosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

```
The mutant thrombin sequence, generated by oligonucleotide-directed mutagenesis, has at least 80% homology with thrombin, and is capable of protein-C activation without significant fibrinogen clotting activity, and vice versa (specifically, it has a ratio of protein-C activity to fibrinogen clotting activity of less than 0.5 or greater than 2 compared to thrombin. The mutant thrombin is produced in recombinant cell culture or by in vitro methods, and is used to treat thrombotic conditions, particularly during cardiac bypass surgery and in cases of septic shock.
                                                                                                                                                        Thrombin derivs with segregated pro- and anticoagulant activities useful for treating thrombotic disorders but also diagnosis, treatment of tumours, etc.
                                                                                                                                                                                                                                                                                                                                            Claim 22; Page 63/3; 78pp; English.

Patent No. 5679639
GENERAL INFORMATION:
APPLICANT: GTIffin, John H.
APPLICANT: Mesters, Rolf M.
TITLE OF INVENTION: Serine Proteas
TITLE OF INVENTION: Anti-Peptide P
TITLE OF INVENTION: for Inhibiting
NUMBER OF SEQUENCES: 10
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      307 YKPDEGKRGDACEGDSGGPFV 327

A;Cross-references: GB:M33031; NID:g190723; PIDN:AAA60220.1; PID:g190724 C;Comment: Thrombin, which cleaves bonds after Arg and Lys, converts fibrinogen to fibri C;Comment: Prothrombin is activated on the surface of a phospholipid membrane that binds of an be removed either by factor Xa or thrombin; the cleavage into light and heavy chaiter 314-Arg, are released in natural blood clotting.
C;Comment: The cleavage after Arg-198, observed in vitro, does not occur in plasma. C;Comment: The gamma-carboxyglutamyl residues bind calcium ions, result from the carboxyglutamyl residues bind calcium ions, result from the carboxyglutamyl charged phospholipid membrane surface.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

RA ITWIN D.M., Ahern K.G., Pearson G.D., McGillivray R.T.A.;

I'Characterization of the bovine prothrombin gene.";

Blochemistry 24:6854-6861(1985).

LI BLOCHAMISTRY 24:6854-6861(1985).

-I- FUNCTION: THROMBIN, WHICH CLEAVES BONDS AFTER ARG & LYS, CONVERTS

TEIBRINGEN TO FIBRIN AND ACTIVATES FACTORS V, VII, VIII, XIII,

AND, IN COMPLEX WITH THROMBONDOULD, PROTEIN C.

-I- CATALYTIC ACTIVITY: Preferential cleavage: Arg-1-Gly; activates

-I- STRUCELLULAR LOCATION: Extracellular.

-I- TISSUE SPECIFICITY: SYWTHESIZED IN THE LIVER; FOUND IN PLASMA.

-I- TISSUE SPECIFICITY: SYWTHESIZED IN THE LIVER; FOUND IN PLASMA.

-I- PTM: THE GAMMA-CARBOXYLGUTAMYL RESIDUES WITH MIND ARGASOMAL

REGULT FROM THE CARBOXYLGUTAMYL RESIDUES BY A MICROSOMAL

REGULT FROM THE CA-DEPENDENT CARBOXYLARE. THE MODIFIED RESIDUES

ARE NECESSARY FOR THE CA-DEPENDENT INTERACTION WITH A NEGATIVELY

CHARGED PHOSPHOLIPID SHURFOWNIN IS ESSENTIAL FOR THE CONVERSION

COF PROTHROMBIN TO THROMBIN.

-I- MISCELLANEOUS: PROTHROMBIN IS ACTIVATED ON THE SURFACE OF A PROSPHOLIPID MEMBRANE THAT BINDS THE REMAINING PART INTO LIGHT FACTORS AS REMOVES

THE ACTIVATION PEPTIDE & CLEAVES STARTS SLOWIX BECAUTE FACTOR

HENCY CHARLEL HAS TO BE ACTIVATED BY THE INITIAL, SMALL AMOUNTS OF

HENCHMAN AND ACTIVATED BY THE INITIAL, SMALL AMOUNTS OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This SWISS-PROT entry is copyright.
